Time-dependent density-functional formalism
(for time being: electrons only, nuclei are fixed or treated classically)

Basic 1-1 correspondence:

$$v(rt) \xleftrightarrow{\text{1-1}} \rho(rt)$$

The time-dependent density determines uniquely the time-dependent external potential and hence all physical observables for fixed initial state.

KS theorem:

The time-dependent density of the <u>interacting</u> system of interest can be calculated as density

$$\rho(rt) = \sum_{j=1}^{N} \left| \varphi_j(rt) \right|^2$$

of an auxiliary <u>non-interacting</u> (KS) system

$$i\hbar \frac{\partial}{\partial t} \varphi_j(rt) = \left(-\frac{\hbar^2 \nabla^2}{2m} + v_S[\rho](rt) \right) \varphi_j(rt)$$
with the <u>local</u> potential

$$v_S[\rho(r't')](rt) = v(rt) + \int d^3r' \frac{\rho(r't)}{|r-r'|} + v_{xc}[\rho(r't')](rt)$$

Proof of basic 1-1 correspondence between $v(\vec{r}\,t)$ **and** $\rho(\vec{r}\,t)$

define maps

$$F: \quad v(\vec{r}\,t) \mapsto \Psi(t)$$

$$\tilde{F}: \quad \Psi(t) \mapsto \rho(\vec{r}\,t)$$

G

potentials
$$v(\vec{r}\,t)$$

F

solve tdSE
with <u>fixed</u>
$\Psi(t_o) = \Psi_o$

wave
functions
$$\Psi(t)$$

$\tilde{F}$

$\rho(\vec{r}\,t) =$
$\langle\Psi(t)|\hat{\rho}(\vec{r})|\Psi(t)\rangle$

$\hat{\rho}(\vec{r}) = \sum_s \hat{\psi}_s^+(\vec{r})\hat{\psi}_s(\vec{r})$

densities
$$\rho(\vec{r}\,t)$$

$$G: \quad v(\vec{r}\,t) \mapsto \rho(\vec{r}\,t)$$

The TDKS equations follow (like in the static case) from:

i. the basic 1-1 mapping and

ii. the TD V-representability theorem (R. van Leeuwen, PRL <u>82</u>, 3863 (1999)).

A TDDFT variational principle exists as well, but this is more tricky (R. van Leeuwen, PRL <u>80</u>, 1280 (1998)).

complete 1 - 1 correspondence not to be expected!

$$i\frac{\partial}{\partial t}\Psi(t) = \left(\hat{T} + \underline{\underline{\hat{V}(t)}} + \hat{W}\right)\Psi(t) \qquad \Psi(t_o) = \Psi_o$$

$$i\frac{\partial}{\partial t}\Psi'(t) = \left(\hat{T} + \underline{\underline{\hat{V}'(t)}} + \hat{W}\right)\Psi'(t) \qquad \Psi'(t_o) = \Psi_o$$

$$\hat{V}'(t) = \hat{V}(t) + C(t) \quad \Leftrightarrow \quad \Psi'(t) = e^{-i\alpha(t)}\Psi(t)$$

"no operator"

$$\text{with} \quad \boxed{\dot{\alpha}(t) = C(t)}$$

$$\Rightarrow \underline{\underline{\rho'(\vec{r}t) = \rho(\vec{r}t)}}$$

$$\text{i.e.} \quad \left\{\hat{V}(t) + C(t)\right\} \quad \rightarrow \quad \rho(\vec{r}t)$$

If G invertible   up to within time-dependent function C(t)

$$\Rightarrow \Psi = FG^{-1}\rho \qquad \text{fixed up to within time-dependent phase}$$

$$\text{i.e.} \quad \Psi = e^{-i\alpha(t)}\Psi[\rho]$$

For any observable $\hat{O}$

$$\left\langle \Psi \left| \hat{O} \right| \Psi \right\rangle = \left\langle \Psi[\rho] \left| \hat{O} \right| \Psi[\rho] \right\rangle = O[\rho]$$

is functional of the density
THEOREM (time-dependent analogue of Hohenberg-Kohn theorem)

The map

$$G: \quad v(\vec{r}t) \mapsto \rho(\vec{r}t)$$

defined for all single-particle potentials $v(\vec{r}t)$ which can be expanded into a Taylor series with respect to the time coordinate around t_o

is invertible up to within an additive merely time-dependent function in the potential.

<u>Proof</u>:
to be shown:

$v(\vec{r}t)$

$v'(\vec{r}t)$

$\rho(\vec{r}t)$

cannot happen

i.e. $\quad \hat{v}(\vec{r}t) \neq \hat{v}'(\vec{r}t) + c(t) \overset{!}{\Rightarrow} \rho(\vec{r}t) \neq \rho'(\vec{r}t)$

potential expandable into Taylor series

$$\exists\, k \geq 0 \quad : \quad \frac{\partial^k}{\partial t^k}\left[v(\vec{r}t) - v'(\vec{r}t)\right]_{t=t_o} \neq \text{constant}$$

<u>step 1</u>

$\vec{j}(\vec{r}t) \neq \vec{j}'(\vec{r}t)$

<u>step 2</u>

$\rho(\vec{r}t) \neq \rho'(\vec{r}t)$

Step 1: Current densities

$$\vec{j}(\vec{r}t) = \left\langle \Psi(t) \left| \hat{\vec{j}}(\vec{r}) \right| \Psi(t) \right\rangle$$

$$\text{with} \quad \hat{\vec{j}}(\vec{r}) = -\frac{1}{2i}\sum_s \left(\left[\vec{\nabla}\hat{\psi}_s^+(\vec{r}) \right] \hat{\psi}_s(\vec{r}) - \hat{\psi}_s^+(\vec{r}) \left[\vec{\nabla}\hat{\psi}_s(\vec{r}) \right] \right)$$

Use equation of motion:

$$i\frac{\partial}{\partial t}\left\langle \Psi(t) \left| \hat{O}(t) \right| \Psi(t) \right\rangle = \left\langle \Psi(t) \left| i\frac{\partial}{\partial t}\hat{O}(t) + \left[\hat{O}(t), \hat{H}(t) \right] \right| \Psi(t) \right\rangle$$

$$\Rightarrow \quad i\frac{\partial}{\partial t}\vec{j}(\vec{r}t) = \left\langle \Psi(t) \left| \left[\hat{\vec{j}}(\vec{r}), \hat{H}(t) \right] \right| \Psi(t) \right\rangle$$
$$i\frac{\partial}{\partial t}\vec{j}'(\vec{r}t) = \left\langle \Psi'(t) \left| \left[\hat{\vec{j}}(\vec{r}), \hat{H}'(t) \right] \right| \Psi'(t) \right\rangle$$

<u>note</u>:

$$\vec{j}(\vec{r}t_o) = \vec{j}'(\vec{r}t_o) = \left\langle \Psi_o \left| \hat{\vec{j}}(\vec{r}) \right| \Psi_o \right\rangle \equiv \vec{j}_o(\vec{r})$$

$$\rho(\vec{r}t_o) = \rho'(\vec{r}t_o) = \left\langle \Psi_o \left| \hat{\rho}(\vec{r}) \right| \Psi_o \right\rangle \equiv \rho_o(\vec{r})$$

$$i\frac{\partial}{\partial t}\left[\vec{j}(\vec{r}t)-\vec{j}'(\vec{r}t)\right]_{t=t_o} = \left\langle \Psi_o \left\| \left[\hat{\vec{j}}(\vec{r}),\hat{H}(t_o)-\hat{H}'(t_o)\right] \right\| \Psi_o \right\rangle$$

$$= \left\langle \Psi_o \left\| \left[\hat{\vec{j}}(\vec{r}),V(t_o)-V'(t_o)\right] \right\| \Psi_o \right\rangle$$

$$= i\rho_o(\vec{r})\vec{\nabla}\left(v(\vec{r}t_o)-v'(\vec{r}t_o)\right)$$

if $\qquad \dfrac{\partial^k}{\partial t^k}\left[v(\vec{r}t)-v'(\vec{r}t)\right]_{t=t_o} \neq$ constant $\qquad$ holds for k=0

then $\quad i\dfrac{\partial}{\partial t}\left[\vec{j}(\vec{r}t)-\vec{j}'(\vec{r}t)\right]_{t=t_o} \neq 0$

$$\Rightarrow \quad \underline{\underline{\vec{j}(\vec{r}t) \neq \vec{j}'(\vec{r}t)}} \qquad \text{q.e.d.}$$

if $\quad \dfrac{\partial^k}{\partial t^k}\left[v(\vec{r}t)-v'(\vec{r}t)\right]_{t=t_o} \neq$ constant $\qquad$ holds for k>0

$\longrightarrow$ <u>use equation of motion k+1 times</u>:

$$\left(i\frac{\partial}{\partial t}\right)^2 \vec{j}(\vec{r}t) = i\frac{\partial}{\partial t}\left\langle \Psi(t)\left\|\left[\hat{\vec{j}},\hat{H}(t)\right]\right\|\Psi(t)\right\rangle$$

$$= \left\langle \Psi(t)\left|i\frac{\partial}{\partial t}\left[\hat{\vec{j}},\hat{H}(t)\right]+\left[\left[\vec{j},\hat{H}(t)\right],\hat{H}(t)\right]\right\|\Psi(t)\right\rangle$$

$$\left(i\frac{\partial}{\partial t}\right)^3 \vec{j}(\vec{r}t) = i\frac{\partial}{\partial t}\left\langle \Psi(t)\left|i\frac{\partial}{\partial t}\left[\vec{j},\hat{H}(t)\right]+\left[\left[\vec{j},H(t)\right],\hat{H}(t)\right]\right\|\Psi(t)\right\rangle$$

$$= \cdots$$

$$\left(i\frac{\partial}{\partial t}\right)^{k+1}\left[\vec{j}(\vec{r}t)-\vec{j}'(\vec{r}t)\right]_{t=t_o} = i\rho_o(\vec{r})\vec{\nabla}\underbrace{\left(\left(i\frac{\partial}{\partial t}\right)^k\left[v(\vec{r}t)-v'(\vec{r}t)\right]_{t_o}\right)}_{\neq \text{ constant}} \neq 0$$

$$\Rightarrow \quad \underline{\vec{j}(\vec{r}t) \neq \vec{j}'(\vec{r}t)} \qquad \text{q.e.d.}$$

Step 2: densities

Use continuity equation:

$$\frac{\partial}{\partial t}\left[\rho(\vec{r}t) - \rho'(\vec{r}t)\right] = -\text{div}\left[\vec{j}(\vec{r}t) - \vec{j}'(\vec{r}t)\right]$$

$$\Rightarrow \quad \frac{\partial^{k+2}}{\partial t^{k+2}}\left[\rho(\vec{r}t) - \rho'(\vec{r}t)\right]_{t=t_o} = -\text{div}\frac{\partial^{k+1}}{\partial t^{k+1}}\left[\vec{j}(\vec{r}t) - \vec{j}'(\vec{r}t)\right]_{t=t_o}$$

$$= -\text{div}\,\rho_o(\vec{r})\vec{\nabla}\left(\underbrace{\frac{\partial^k}{\partial t^k}\left[v(\vec{r}t) - v'(\vec{r}t)\right]_{t=t_o}}_{\neq\,\text{constant}}\right)$$

remains to be shown:

$$\text{div}\left[\rho_o(\vec{r})\vec{\nabla}u(\vec{r})\right] \neq 0 \qquad \text{if} \qquad u(\vec{r}) \neq \text{constant}$$

Proof: by reductio ad absurdum

Assume: $\operatorname{div}\left[\rho_o(\vec{r})\vec{\nabla}u(\vec{r})\right] = 0$ with $u(\vec{r}) \neq$ constant

$$\int dr^3 \rho_o(\vec{r}) \left(\vec{\nabla}u(\vec{r})\right)^2$$

$$= -\int dr^3 u(\vec{r}) \underbrace{\operatorname{div}\left[\rho_o(\vec{r})\vec{\nabla}u(\vec{r})\right]}_{0} + \underbrace{\oint \rho_o(\vec{r})u(\vec{r})\vec{\nabla}u(\vec{r})\cdot d\vec{S}}_{0} = 0$$

$$\Rightarrow \rho_o(\vec{r})\left(\vec{\nabla}u(\vec{r})\right)^2 \equiv 0 \longrightarrow \begin{array}{l}\text{contradiction to} \\ u(\vec{r}) \neq \text{constant}\end{array}$$

$$\boxed{\textbf{Simplest possible approximation for } \mathrm{v}_{xc}[\rho](\vec{r}\,t)}$$

Adiabatic Local Density Approximation (ALDA)

$$v_{xc}^{ALDA}(\vec{r}\,t) := v_{xc,stat}^{hom}(n)\Big|_{n=\rho(\vec{r}\,t)}$$

$v_{xc,stat}^{hom}$ **= xc potential of static homogeneous e-gas**

Approximation with correct asymptotic -1/r behavior: time-dependent optimized effective potential

(C. A. Ullrich, U. Gossmann, E.K.U.G., PRL 74, 872 (1995))

LINEAR RESPONSE THEORY

$t = t_0$: **Interacting system in ground state of potential $v_0(r)$ with density $\rho_0(r)$**

$t > t_0$: **Switch on perturbation $v_1(r\,t)$ (with $v_1(r\,t_0)=0$).**

Density: $\rho(r\,t) = \rho_0(r) + \delta\rho(r\,t)$

Consider functional $\rho[v](r\,t)$ defined by solution of interacting TDSE

Functional Taylor expansion of $\rho[v]$ around v_o:

$$\rho[v]\,(rt) = \rho\big[v_0 + v_1\big]\,(rt)$$

$$= \rho[v_0](rt) \qquad\qquad\qquad\qquad\longrightarrow \rho_o(r)$$

$$+ \int \left.\frac{\delta\rho[v](rt)}{\delta v(r't')}\right|_{v_0} v_1(r't')\, d^3r'dt' \qquad\longrightarrow \rho_1(rt)$$

$$+ \frac{1}{2}\int\int \left.\frac{\delta^2\rho[v](rt)}{\delta v(r't')\delta v(r''t'')}\right|_{v_0} v_1(r',t')v_1(r'',t'')\, d^3r'd^3r''dt'dt'' \longrightarrow \rho_2(rt)$$

$$\vdots$$

$\rho_1(r,t)$ = **linear density response of interacting system**

$$\chi(rt,r't') := \left.\frac{\delta\rho[v](rt)}{\delta v(r't')}\right|_{v_0} = \text{ density-density response function of interacting system}$$

Analogous function $\rho_s[v_s](r\,t)$ for _non_-interacting system

$$\rho_S[v_S](rt) = \rho_S\left[v_{S,0} + v_{S,1}\right](rt) = \rho_S\left[v_{S,0}\right](rt) + \int \left.\frac{\delta\rho_S[v_S](rt)}{\delta v_S(r't')}\right|_{v_{S,0}} v_{S,1}(r't')\, d^3r'dt' + \cdots$$

$$\chi_S(rt,r't') := \left.\frac{\delta\rho_S[v_S](rt)}{\delta v_S(r't')}\right|_{v_{S,0}} = \text{ density-density response function of \underline{non}-interacting system}$$

GOAL: Find a way to calculate $\rho_1(r\,t)$ without explicitly evaluating $\chi(r\,t, r't')$ of the <u>interacting</u> system

<u>starting point</u>: Definition of xc potential

$$v_{xc}[\rho](rt) := v_S[\rho](rt) - v_{ext}[\rho](rt) - v_H[\rho](rt)$$

<u>Notes</u>:
- v_{xc} is well-defined through non-interacting $/$ interacting 1-1 mapping.
- $v_S[\rho]$ depends on initial determinant Φ_0.
- $v_{ext}[\rho]$ depends on initial many-body state Ψ_0.

$\Rightarrow$ In general, $v_{xc} = v_{xc}\left[\rho, \Phi_0, \Psi_0\right]$

only if system is initially in <u>ground-state</u> then, via HK, Φ_0 and Ψ_0 are determined by ρ_0 and v_{xc} depends on ρ alone.

$$\left.\frac{\delta v_{xc}[\rho](rt)}{\delta\rho(r't')}\right|_{\rho_0} = \left.\frac{\delta v_S[\rho](rt)}{\delta\rho(r't')}\right|_{\rho_0} - \left.\frac{\delta v_{ext}[\rho](rt)}{\delta\rho(r't')}\right|_{\rho_0} - \frac{\delta(t-t')}{|r-r'|}$$

$$\left.\frac{\delta v_{xc}[\rho](rt)}{\delta\rho(r't')}\right|_{\rho_0} = \left.\frac{\delta v_S[\rho](rt)}{\delta\rho(r't')}\right|_{\rho_0} - \left.\frac{\delta v_{ext}[\rho](rt)}{\delta\rho(r't')}\right|_{\rho_0} - \frac{\delta(t-t')}{|r-r'|}$$

$$\uparrow \qquad\qquad \uparrow \qquad\qquad \uparrow \qquad\qquad \uparrow$$

$$f_{xc}(rt,r't') \qquad \chi_S^{-1}(rt,r't') \qquad \chi^{-1}(rt,r't') \qquad W_C(rt,r't')$$

$$\left.\frac{\delta v_{xc}[\rho](rt)}{\delta\rho(r't')}\right|_{\rho_0} = \left.\frac{\delta v_S[\rho](rt)}{\delta\rho(r't')}\right|_{\rho_0} - \left.\frac{\delta v_{ext}[\rho](rt)}{\delta\rho(r't')}\right|_{\rho_0} - \frac{\delta(t-t')}{|r-r'|}$$

$$\uparrow \qquad\qquad \uparrow \qquad\qquad \uparrow \qquad\qquad \uparrow$$

$$f_{xc}(rt,r't') \qquad \chi_S^{-1}(rt,r't') \qquad \chi^{-1}(rt,r't') \qquad W_C(rt,r't')$$

$$f_{xc} + W_C = \chi_S^{-1} - \chi^{-1}$$

$$\frac{\delta v_{xc}[\rho](rt)}{\delta \rho(r't')}\bigg|_{\rho_0} = \frac{\delta v_S[\rho](rt)}{\delta \rho(r't')}\bigg|_{\rho_0} - \frac{\delta v_{ext}[\rho](rt)}{\delta \rho(r't')}\bigg|_{\rho_0} - \frac{\delta(t-t')}{|r-r'|}$$

$$\uparrow \qquad\qquad \uparrow \qquad\qquad \uparrow \qquad\qquad \uparrow$$

$$f_{xc}(rt,r't') \qquad \chi_S^{-1}(rt,r't') \qquad \chi^{-1}(rt,r't') \qquad W_C(rt,r't')$$

$$\chi_S \cdot \bigg| \, f_{xc} + W_C = \chi_S^{-1} - \chi^{-1} \, \bigg| \cdot \chi$$

$$\frac{\delta v_{xc}[\rho](rt)}{\delta\rho(r't')}\Bigg|_{\boldsymbol{\rho_0}} = \frac{\delta v_{S}[\rho](rt)}{\delta\rho(r't')}\Bigg|_{\boldsymbol{\rho_0}} - \frac{\delta v_{ext}[\rho](rt)}{\delta\rho(r't')}\Bigg|_{\boldsymbol{\rho_0}} - \frac{\delta(t-t')}{|r-r'|}$$

$$\uparrow \qquad\qquad \uparrow \qquad\qquad \uparrow \qquad\qquad \uparrow$$

$$f_{xc}(rt,r't') \qquad \chi_S^{-1}(rt,r't') \qquad \chi^{-1}(rt,r't') \qquad W_C(rt,r't')$$

$$\color{red}{\chi_S}\,\bullet\,\color{red}{\Big|}\,\color{black}{f_{xc}+W_C=\chi_S^{-1}-\chi^{-1}}\,\color{red}{\Big|}\,\bullet\,\chi$$

$$\chi_S\left(f_{xc}+W_C\right)\chi=\chi-\chi_S$$

$$\chi = \chi_S + \chi_S \left(W_C + f_{xc} \right) \chi$$

Act with this operator equation on arbitrary $v_1(r\,t)$ and use $\chi\, v_1 = \rho_1$:

$$\rho_1 \left(rt \right) = \int d^3 r' dt' \chi_S \left(rt, r't' \right) \left[v_1 \left(rt \right) + \int d^3 r'' dt'' \left\{ W_C \left(r't', r''t'' \right) + f_{xc} \left(r't', r''t'' \right) \right\} \rho_1 \left(r''t'' \right) \right]$$

- Exact integral equation for $\rho_1(r\,t)$, to be solved iteratively

- Need approximation for $\quad f_{xc} \left(r't', r''t'' \right) = \left. \dfrac{\delta v_{xc} \left[\rho \right] \left(r't' \right)}{\delta \rho \left(r''t'' \right)} \right|_{\rho_0}$
  (either for f_{xc} directly or for v_{xc})

Adiabatic approximation

$$v_{xc}^{adiab}[\rho](rt) := v_{xc}^{static\ DFT}[\rho(t)](rt)$$

In the adiabatic approximation, the xc potential $v_{xc}(t)$ at time t only depends on the density $\rho(t)$ at the very same point in time.

e.g. adiabatic LDA: $v_{xc}^{ALDA}(rt) := v_{xc}^{LDA}(\rho(rt)) = -\alpha\,\rho(rt)^{1/3} + \cdots$

$$\Rightarrow\ f_{xc}^{ALDA}(rt, r't') = \left.\frac{\delta v_{xc}^{ALDA}(rt)}{\delta\rho(r't')}\right|_{\rho_0} = \delta(r-r')\delta(t-t')\left.\frac{\partial v_{xc}^{ALDA}}{\partial\rho(r)}\right|_{\rho_0(r)}$$

$$= \delta(r-r')\delta(t-t')\left.\frac{\partial^2 e_{xc}^{hom}}{\partial n^2}\right|_{\rho_0(r)}$$

Total photoabsorption cross section of the Xe atom versus photon energy in the vicinity of the 4d threshold.
Solid line: self-consistent time-dependent KS calculation [A. Zangwill and P. Soven, PRA 21, 1561 (1980)]; crosses: experimental data [R. Haensel, G. Keitel, P. Schreiber, and C. Kunz, Phys. Rev. 188, 1375 (1969)].

Photo-absorption in weak lasers
No absorption if ω < lowest excitation energy

Standard linear response formalism

H(t₀) = full static Hamiltonian at t₀

$$H\left(t_0\right)\left|m\right> = E_m \left|m\right>$$ ← **exact many-body eigenfunctions and energies of system**

full response function

$$\chi\left(r,r';\omega\right) = \lim_{\eta \to 0^+} \sum_m \left(\frac{\left<0|\hat{\rho}(r)|m\right>\left<m|\hat{\rho}(r)|0\right>}{\omega - \left(E_m - E_0\right) + i\eta} - \frac{\left<0|\hat{\rho}(r')|m\right> \left<m|\hat{\rho}(r')|0\right>}{\omega + \left(E_m - E_0\right) + i\eta} \right)$$

$\Rightarrow$ **The exact linear density response**

$$\rho_1\left(\omega\right) = \hat{\chi}\left(\omega\right) v_1\left(\omega\right)$$

has poles at the exact excitation energies $\Omega = E_m - E_0$

Discrete excitation energies from TDDFT

exact representation of linear density response:

$$\rho_1(\omega) = \hat{\chi}_S(\omega)\left(v_1(\omega) + \hat{W}_C\rho_1(\omega) + \hat{f}_{xc}(\omega)\rho_1(\omega)\right)$$

"^" denotes integral operators, i.e. $\hat{f}_{xc}\rho_1 \equiv \int f_{xc}(\vec{r}, \vec{r}')\rho_1(\vec{r}')d^3r'$

where $\hat{\chi}_S(\vec{r}, \vec{r}'; \omega) = \sum\limits_{j,k} \dfrac{M_{jk}(\vec{r}, \vec{r}')}{\omega - (\varepsilon_j - \varepsilon_k) + i\eta}$

with $M_{jk}(\vec{r}, \vec{r}') = (f_k - f_j)\varphi_j(\vec{r})\varphi_j^*(\vec{r}')\varphi_k(\vec{r}')\varphi_k^*(\vec{r})$

$$f_m = \begin{cases} 1 \text{ if } \varphi_m \text{ is occupied in KS ground state} \\ 0 \text{ if } \varphi_m \text{ is unoccupied in KS ground state} \end{cases}$$

$\varepsilon_j - \varepsilon_k$ KS excitation energy

$$\left(\hat{1} - \hat{\chi}_S(\omega) \left[\hat{W}_C + \hat{f}_{xc}(\omega) \right] \right) \rho_1(\omega) = \hat{\chi}_S(\omega) v_1(\omega)$$

$\rho_1(\omega) \rightarrow \infty$ for $\omega \rightarrow \Omega$ (exact excitation energy) but right-hand side remains finite for $\omega \rightarrow \Omega$

hence $\left(\hat{1} - \hat{\chi}_S(\omega) \left[\hat{W}_C + \hat{f}_{xc}(\omega) \right] \right) \xi(\omega) = \lambda(\omega) \xi(\omega)$

$\lambda(\omega) \rightarrow 0$ for $\omega \rightarrow \Omega$

This condition rigorously determines the exact excitation energies, i.e.,

$$\left(\hat{1} - \hat{\chi}_S(\Omega) \left[\hat{W}_C + \hat{f}_{xc}(\Omega) \right] \right) \xi(\Omega) = 0$$

This leads to the (non-linear) eigenvalue equation

(See T. Grabo, M. Petersilka, E. K. U. G., J. Mol. Struc. (Theochem) <u>501</u>, 353 (2000))

$$\sum_{q'} \left(A_{qq'}(\Omega) + \omega_q \delta_{qq'} \right) \beta_{q'} = \Omega \beta_q$$

where

$$A_{qq'} = \alpha_{q'} \int d^3r \int d^3r' \Phi_q(r) \left(\frac{1}{|r - r'|} + f_{xc}(r, r', \Omega) \right) \Phi_{q'}(r')$$

$$q = (j, a) \text{ double index} \qquad \alpha_q = f_a - f_j$$

$$\Phi_q(r) = \varphi_a^*(r) \varphi_j(r) \qquad \omega_q = \varepsilon_a - \varepsilon_j$$

Failures of ALDA in the linear response regime

- **H_2 dissociation is incorrect:**

$$E\left(^1\Sigma_u^+\right) - E\left(^1\Sigma_g^+\right) \xrightarrow[R\to\infty]{} 0 \text{ (in ALDA)}$$

(see: Gritsenko, van Gisbergen, Görling, Baerends, JCP 113, 8478 (2000))

- **response of long chains strongly overestimated**

(see: Champagne et al., JCP 109, 10489 (1998) and 110, 11664 (1999))

- **in periodic solids, $f_{xc}^{ALDA}\left(q,\omega,\rho\right) = c\left(\rho\right)$ whereas,**

for insulators, $f_{xc}^{exact} \xrightarrow[q\to 0]{} 1/q^2$ divergent.

- **charge-transfer excitations not properly described**

(see: Dreuw et al., JCP 119, 2943 (2003))

How good is ALDA for solids?

optical absorption (q=0)

Solid Argon

OBSERVATION:
In the long-wavelength-limit (q = 0), relevent for optical absorption, ALDA is not reliable. In particular, excitonic lines are completely missed. Results are very close to RPA.

EXPLANATION:
In the TDDFT response equation, the bare Coulomb interaction and the xc kernel only appear as sum ($W_C + f_{xc}$). For $q \rightarrow 0$, W_C diverges like $1/q^2$, while f_{xc} in ALDA goes to a constant. Hence results are close to $f_{xc} = 0$ (RPA) in the $q \rightarrow 0$ limit.
CONCLUSION:
Approximations for f_{xc} are needed which, for $q \rightarrow 0$, correctly diverge like $1/q^2$. Such approximations can be derived from many-body perturbation theory (see, e.g., L. Reining, V. Olevano, A. Rubio, G. Onida, PRL **88**, 066404 (2002)).
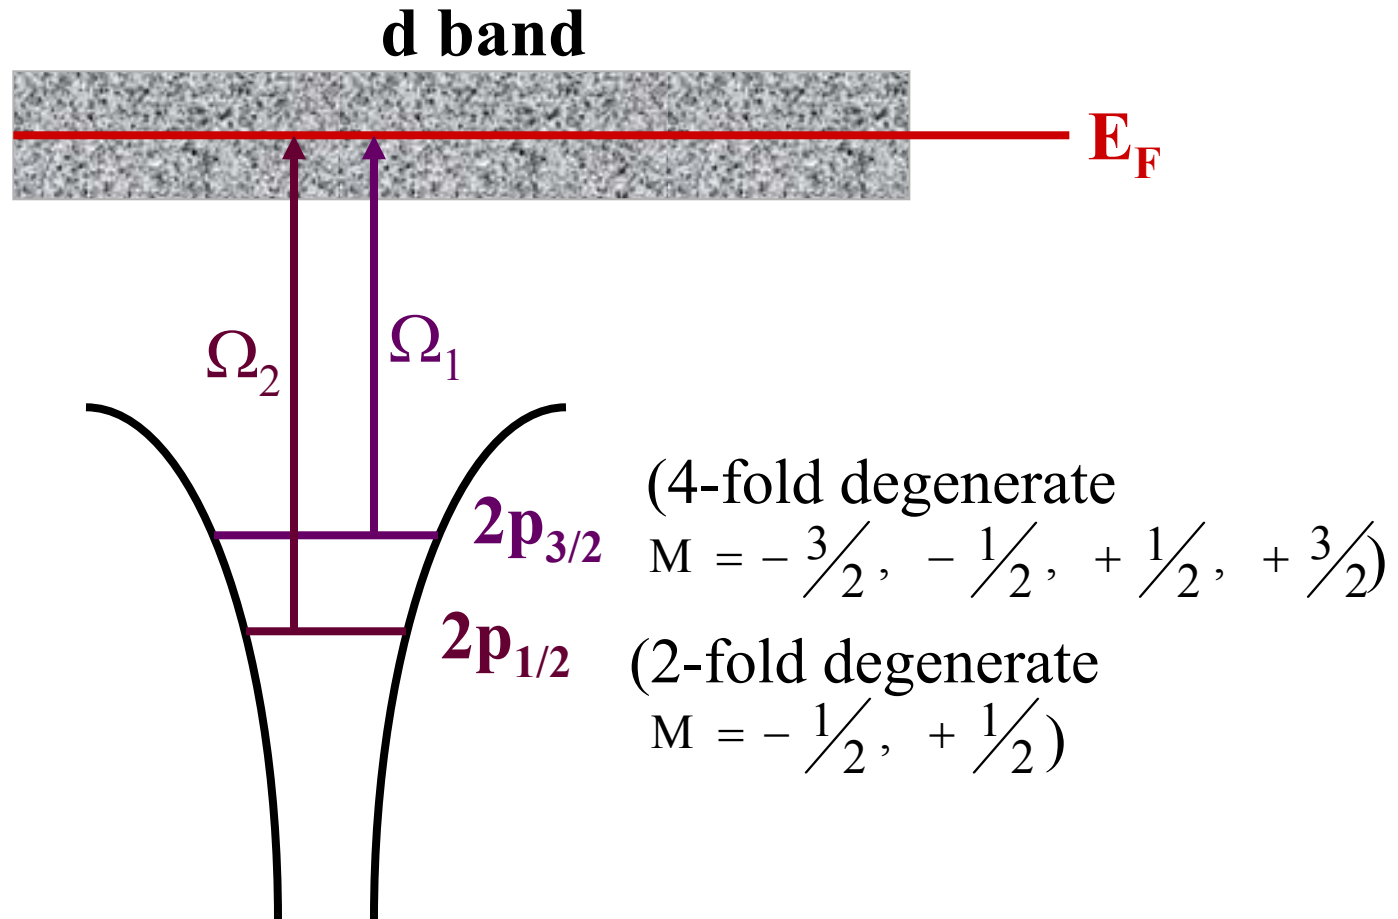

WHAT ABOUT FINITE Q??

Detailed analysis using two-pole approximation

$$\begin{pmatrix} \omega_1 + M_{11} & M_{12} \\ M_{21} & \omega_2 + M_{22} \end{pmatrix} \beta = \Omega \beta$$

From knowledge of the KS orbitals and the KS excitation energies ω_1, ω_2 and the experimental excitation energies Ω_1, Ω_2 and their branching ratio, one can deduce experimental values for the matrix elements M_{ij}, i.e. one can "measure" f_{xc}.
